

Moving water in hard to wet soils

Aqueduct® Granular has been proven to substantially enhance the infiltration of water into hard to wet soils. It helps distribute water and applied chemicals into and throughout the soil profile and into the rootzone. Aqueduct Granular is safe to turf and plants and can be used on turf or landscape beds where hard to wet soil is exhibited.

Aqueduct Granular is specifically formulated to improve infiltration of water into the soil profile. This allows you to:

- Treat dry spots on turf
- Improve new plant / shrub survival

Why should you use Aqueduct Granular?

- Move water through hard to wet soils
- Minimize water lost to run off
- Improve the appearance of turf
- Reduce stress caused by water repellency
- Increase survival rate of newly planted landscape plants/shrubs
- Convenient granular formulation is safe and easy to use

Application Rate

Apply Aqueduct Granular at 2½ lbs/1000 sq ft to turf or landscape areas exhibiting signs of stress due to hard to wet soils.

Turf exhibiting severe LDS (localized dry spot), was treated with Aqueduct Granular at 2½ lbs/1000 sq ft.

BEFORE TREATMENT

Three weeks later the affected area was completely recovered.

AFTER TREATMENT
