

Boosting Efficiency: Fertilizers, Insecticides and Fungicides

Keep money in your pocket and make sure your plants get what they need.

With the high cost of chemicals, it's important to maximize performance and minimize waste. Apply AquaGro L throughout the production cycle, and control where water goes after it leaves the spray nozzle or drip emitter and where that water takes your fertilizer, insecticide and fungicide. AquaGro L moves water (and everything it carries) uniformly throughout the rootzone, minimizing the amount lost to runoff, leaching and ultimately reducing irrigation frequency.

- Improve the performance of fertilizers and other soil directed products.
- Less leaching & waste of fertilizer and chemicals.
- Reduce the need for extra fertilizer, fungicides and labor.
- Keep production costs down & keep profitability up.

- Treated plants had better developed root systems and more vibrant, healthy blooms.
- Untreated plants had to be watered twice a day, treated plants required watering only once per day.
- Grower was able to maximize water and fertilizer applications.
