

Greens & Tees

Whether your winter has been wet or dry, starting a Revolution program early will help optimize air-to-water ratios in the root zone for a better growing environment and healthier turf. If it has been wet, Revolution will move excess water off of the surface and through the soil profile. If it has been dry, Revolution ensures rain and irrigation will get into the root zone so your turf gets the uniform moisture it needs.

Revolution should be applied monthly at 6oz/1000 ft². By starting with Revolution in the spring you can ensure your turf is healthy and ready for play in wet or dry conditions.

Fairways

Want to improve your irrigation efficiency and increase the efficacy of soil directed chemicals this year? Use Dispatch on your fairways. As soon as irrigation begins, you should inject Dispatch at 12-24 ounces per acre weekly. Dispatch gives you improved water savings, less waste and run-off, and improved fertilizer, pesticide and herbicide performance. Get water where it needs to go and improve your turf with Dispatch. Also available in Sprayable formula.

Recovery of Problem Spots

Winter can be hard on turf. Before you start a monthly program, you may need to repair damage done by harsh winter conditions. Apply Aqueduct SWDG to repair damaged turf, protect against water repellency and manage soil moisture without a spray rig.

Aqueduct SWDG can be applied safely in late winter/early spring without watering in. Aqueduct is also available in liquid formula.

Spring is Coming – Are You Ready?

As spring approaches you want to have the tools available to help your turf out of the winter doldrums and into spring vibrancy. Uniform soil moisture and balanced air to water ratios are critical in making sure your turf is healthy and has the greatest chance of getting a strong start in coming out of winter dormancy.

Whether you need to seed or sod to repair winter damage, or just need to “wake up” the rootzone to get your turf off to a good start, don’t let water movement issues get in the way of great turf. Aquatrols puts you in control of water movement in the soil profile, even early in the season.

We offer a selection of soil surfactant tools to help get your course ready to play as quickly as possible. We can help you design a late winter/early spring program so your turf can rebound from winter and get healthy before the heat of summer brings stress and disease pressure. Start now for better turf throughout the year.
